

The seminar for "Seismic Isolation for Architect"

Prof. Adriana Guisasola, Dep. Structures-Faculty of Architecture, Urban Planning and Design-University of Mendoza presented her subject titled "Seismic Isolation for Architect" to the audience from JIA and JSSI, on 7th, Nov. 2016. The venue was in JIA building. The professor explained the participants about the important matters on seismic isolation as follows;

1. Education
2. Applications
3. Confidence
4. Architectural benefits of seismic isolation, limitation of seismic isolation, issues for structural engineers
5. Economics
6. Conclusions

The most significant point is “after earthquake benefits”;

1. Reducing trauma to building occupants
2. Reducing injuries to them and passers-by
3. No or minimal structural damage, also non-structural elements
4. No or minimal disruption to occupancy and function

All these advances are expected to result in safer buildings and communities.

As a result, we are able to get "Business Continuity"

Her presentation made us feel again that more dissemination of seismic isolation technology must be needed for the society in the world.
